

Sanitizing your hands is important, so is sanitizing your truck

In today's environment, it is even more important to follow safety guidelines to prevent and protect against contamination. With increasing efforts to boost sanitation and disinfection - **did you know the End Rider uses impenetrable materials on all its touch points?**

Impenetrable materials such as our closed cell rubber and engineered composites are important because they...

- Do not trap bacteria or foreign agents that could cause contamination
- Reduce vapor transmission making the touch points less likely to absorb water or bacteria
- Allow for thorough surface sanitization of equipment through non-porous cells

Impenetrable materials are also used on the:

- 1 Control handle and buttons
- 2 Hand rail with auxiliary controls
- 3 Integrated knee pads
- 4 Operator platform and cushion
- 5 Motor cover
